

Freeland Cleaning Pellet Instructions

There are various jags available for felt cleaning pellets with various tip widths.

The most common is the pointed tip jag that comes with the Dewey Cleaning Rods

The Dewey pointed tip jag is .065" width (smaller than VFG jags) but will fit these pellets

HOWEVER the cleaning pellet you purchased will also fit larger tip VFG Jags as well.

We offer a slightly larger tip for cleaning pellets to get a bit more friction using .1" diameter tip

All it takes to get the pellet on tip is to get it centered on the tip and spin it onto the jag with a little force and it will slide right on.

You can leave it like that, or fully insert it

Dewey offers a VFG Jag with 2 diameters on same jag, it starts with narrow tip .95" wide tip and goes to .145" thread. The VFG jag has 2 diameters to help get more friction on the bore because of bigger hole used on the VFG pellets.

Same technique of centering on the hole and spinning it will work with larger Jags too.

You can also fully insert it, pictured below

When inserting on a larger diameter jag you will notice the length of the pellet will grow accommodating for the increased diameter of the jag.

With the right technique of spinning it on the jag the Freeland cleaning pellets will work with both large and small point jags and will provide adequate friction for cleaning the bore.

The fine fibers provide brush-like scrubbing properties due to the high fiber thread count. The felt pad absorbs liquids and can trap large and small particles of dirt in its tangled fiber structure thus removing them out of the bore. Fibers are harmless and exceptionally gentle. Pellets can bring metal surfaces to a high polish.

Various pellet sizes are available to meet all your cleaning needs.
